

David Sammartino

I actually made 300whp on 1.2 bar later that night but its not in the video

They left a vacuum hose off on that run when they connected boost sensor to their dyno hence only 1 bar

Also for ur information before this i ran a 20t, and on 1.2 bar only made 270whp, so your wheels must be higher efficiency id say

Yes, I can honestly say that all the turbos I upgrade will produce more power and more efficiently. That's also good to see though

They always produce less exhaust and intake pressures
